

1. (Twice amended) A system for denoting and communicating with a mobile site wirelessly couplable to [a fixed site of] a computer network, comprising:

an address parser that makes a determination of whether a site is said mobile site or [said]
a fixed site of said computer network;

a mirror site, couplable to said computer network, [wherein said mirror site is a mirror update of said mobile site] that contains a time-delayed copy of data present at said mobile site; and

a communications manager that manages communication with said site based on said determination, said communications manager directing said communication, when said site is a mobile site, either to said mobile site when said mobile site is [available] in wireless communication with said computer network or to said mirror site when said mobile site is [unavailable] out of wireless communication with said computer network.

Kindly rewrite Claim 8 as follows:

8. (Twice amended) A method of denoting and communicating with a mobile site wirelessly couplable to [a fixed site of] a computer network, comprising:

making a determination of whether said site is said mobile site or [said] a fixed site of said computer network; and

managing communication with said site based on said determination, where said communications managing includes directing said communication, when said site is a mobile site, either to said mobile site when said mobile site is [available] in wireless communication with said computer network or to a mirror site of said mobile site when said mobile site is [unavailable] out of wireless communication with said computer network, said mirror site [couplable to said computer

network, wherein said mirror site includes data from a mirror update of said mobile site] containing
a time-delayed copy of data present at said mobile site.

Kindly rewrite Claim 15 as follows:

15. (Twice amended) A computer network, comprising:
fixed sites having fixed-site domain names associated therewith;
mobile sites having mobile-site domain names associated therewith;
a communications infrastructure that couples ones of said pluralities of fixed and mobile
sites for communication therebetween;
an address parser that makes a determination of whether a site is one of said mobile sites
or one of said fixed sites;
a mirror site, couplable to said computer network, [wherein said mirror site is a mirror
update of said mobile site] that contains a time-delayed copy of data present at said mobile site; and
a communications manager that manages communication with said site based on said
determination, said communications manager directing said communication, when said site is a
mobile site, either to said mobile site when said mobile site is [available] in wireless communication
with said computer network or to said mirror site when said mobile site is [unavailable] out of
wireless communication with said computer network.
